GENERAL PRODUCT INFORMATION

Gentamicin injection is the first-line drug recommended by WHO for the treatment of community acquired pneumonia (severe), complicated severe acute malnutrition, and sepsis in neonates and children. It is also considered an essential medicine for child health by the UN Commission on Life-Saving Commodities.

Gentamicin for injection is presented as an aqueous solution of gentamicin sulfate, mostly available in 2-mL vials or ampoules in two concentrations (10 mg/mL or 40 mg/mL). Gentamicin is also available in eye drops for ophthalmological infections, in ear drops for ear infections, and as a topical ointment for skin infections.

The scope of this manual includes only the presentation described in the WHO Essential Medicines List for Children (EMLc) that is gentamicin injection 10 mg/mL and 40 mg/mL (as sulfate) in 2-mL vial.
**KEY CONSIDERATIONS IN PROCUREMENT**

1. Procurement should be made from trusted sources. This includes manufacturers whose gentamicin injection has been approved by an SRA or accepted by the United Nations Children’s Fund (UNICEF), and those with a proven record of quality products.

2. Procurers need to focus on product quality to ensure that it is safe for patient use as.

**KEY QUALITY CONSIDERATIONS**

**Product specification**

The product must comply with the quality specifications as detailed in the Annex.

**Packaging and labeling**

Gentamicin injection should be procured in vial presentations as per the WHO EMLc recommendation of 10 mg/mL and 40 mg/mL (as sulfate) in 2-mL vial. For typical neonatal dosages, approximately two doses could be obtained from a 10-mg/mL vial and up to eight doses from a 40 mg/mL vial. Note that some SRA-approved products may be presented in ampoules. For ampoules, any medicine not immediately used would have to be discarded, as it cannot be resealed.

The container-closure system (vial and rubber stopper) must be sufficient to preserve sterility during the shelf life of the product.

While pediatric ampoules exist for the intramuscular injections to newborns, the volumes are smaller if the 80 mg/2 ml ampoule is used (it is less painful for the patient). In this situation, syringes and needles of the right sizes for newborns should be considered in the procurement.

Note: Due to the calculations needed to determine the dose volume by weight of the infant, health workers at the primary care level may have difficulty accurately determining the correct amount of drug they should administer. A custom-marked syringe would be best as a 1-mL syringe with 0.2 increment markings most relevant for gentamicin administration, so it may be that a regularly marked 1-mL syringe can be used effectively by health care workers for this purpose. Based on a literature review, the syringe specifications shown in the table below are optimal for IM delivery of gentamicin in neonate.¹

Additional information about the packaging and labeling can be found in the Annex.

**Storage, transportation, and distribution**

Procurers need to verify from manufacturers there is satisfactory stability data to support shelf life and storage conditions.

Gentamicin injection does not need to be maintained in the cold chain, but should be stored below 25°C.

Procurers must ensure that the product is stored safely so that the vial cannot break or leak, which would compromise its sterility.

Additional information about the misoprostol finished product storage requirement can be found in the “Storage, Stability and Degradation” section.

**Other considerations**

Gentamicin injection must be manufactured in a sterile facility.
Gentamicin

**Name of the Medicinal Product**

Gentamicin injection

**Chemical Name**

Gentamicin sulfate

Gentamicin sulfate is the sulfate salt of gentamicin fractions C₁, C₂, and C₁₆ produced by the growth of *Micromonospora purpurea*.

**Chemical Structure**

![Chemical Structure Diagram]

**Pharmaceutical Form**

Sterile solution for injection

A clear, colorless solution

**Qualitative and Quantitative Composition**

Gentamicin injection is a sterile solution of gentamicin sulfate in water for injection.

- Gentamicin injection 10 mg/mL: each vial (2 mL) contains gentamicin sulfate equivalent to 20 mg gentamicin base.
- Gentamicin injection 40 mg/mL: each vial (2 mL) contains gentamicin sulfate equivalent to 80 mg gentamicin base.

List of excipients:

- Sodium chloride
- Water for injection
- Sulfuric acid and/or sodium hydroxide, for pH adjustment

Some formulations may contain the following excipients:

- Methylparaben (preservative)
- Propylparaben (preservative)
- Sodium metabisulfite (antioxidant)
- Edetate disodium (chelating agent)

**Packaging and Presentation**

The WHO EMLc includes two presentations: 10 mg/mL and 40 mg/mL in 2-mL vial presentation for gentamicin injection. However, some manufacturers sell it packaged in glass ampoules.

---

2 Based on the formulation of an innovator product, Cidomycin®.
Gentamicin

**SUPPLY**

Generally, products prequalified by the WHO PQP and/or approved by an SRA are considered quality-assured and highly recommended for procurement. In the absence of WHO-prequalified, SRA-approved, or ERP recommended products, medicines from trusted sources, such as manufacturers approved by UN agencies, can be considered for procurement. Alternatively, the procurement agency may conduct its own quality assessment as described in Module II.

**WHO-prequalified products**

Gentamicin is not included in the WHO PQP. Therefore, no WHO-prequalified gentamicin products are available.

**SRA-approved products**

</table>
It should be noted that the list of SRA-approved products provided above is not exhaustive. The list may be changed over time. When a manufacturer claims that its product is approved by an SRA, they should provide the following information/documents to prove the SRA approval:

- A copy of the marketing authorization issued by the reference SRA
- The approved product information (e.g., Summary of Product Characteristics, patient information leaflet, and the labeling by the reference SRA)
- A statement confirming the FPP—including but not limited to composition/formulation, strength, manufacturing, specifications, packaging, product information—will in all respects be the same as the product approved by the reference SRA
- Product sample

The procurer may cross check the submitted information with the corresponding NMRA websites:

- EU regulatory authorities: https://ec.europa.eu/health/documents/community-register/regca_en

**Trusted sources**

Gentamicin injection from the following manufacturers are listed by UNICEF as approved sources for procurement:

- Gland Pharma Ltd, India
- Intas Pharmaceuticals Ltd, India

It is recommended to check for updated information on the UNICEF website at the time of procurement.

**Related Products**

Other formulations of gentamicin on the market include:

- Gentamicin 1 mg/mL solution for injection
- Gentamicin 3 mg/mL solution for infusion
- Gentamicin eye/ear drops 0.3% w/v
- Gentamicin intrathecal 5 mg/mL solution for injection
- Implants—each chain consists of 10, 30, or 60 beads (each bead contains 7.5 mg gentamicin sulfate)

1 Available at https://www.unicef.org/supply/index_27009.html
Gentamicin

It is important to note that the WHO EMLc recommends gentamicin injection 10 mg/mL and 40 mg/mL (as sulfate) in 2-mL vial for the treatment of community-acquired pneumonia (severe), complicated severe acute malnutrition, and sepsis in neonates and children. Therefore, the procurement agency must focus on procurement of those presentations as per the WHO EMLs.

**STORAGE, STABILITY, AND DEGRADATION**

Gentamicin injection is stable at room temperature and does not require cold chain storage.

Shelf life: 2–4 years, depending on the manufacturer. It is recommended to check the product label before use.

Storage conditions: Do not store above 25°C. Do not refrigerate or freeze. Protect from light.

The shelf life and storage condition of each SRA-approved product can be found in Table G-1.

**PRODUCT SPECIFICATIONS**

The product must meet pharmacopoeial specifications, such as those of the US Pharmacopoeia and British Pharmacopoeia, depending on the quality assurance policy of the procurement agency, or the equivalent thereof. The testing parameters and acceptance criteria of the two pharmacopoeias are similar, except the assay limits and the composition of gentamicin sulfate (required only in the BP).

**PART 1: CLINICAL PARTICULARS**

**Therapeutic indications**

Gentamicin is a first-line treatment for community acquired pneumonia (severe), complicated severe acute malnutrition, and sepsis in neonates and children.

Gentamicin injection is also indicated in urinary tract infections, chest infections, bacteremia, septicemia, severe neonatal infections, and other systemic infections due to sensitive organisms.

**Posology, method, and duration of administration**

**Pneumonia**

*Neonatal pneumonia*

- 2.5 mg/kg IV every 8 hours (neonates <7 days: 2.5 mg/kg IV every 12 hours), together with amoxicillin 30 mg/kg IV every 12 hours for a total of at least 5 days

*Pneumonia due to Staphylococcus aureus in children age 2 months–5 years*

- 7.5 mg/kg IV in 1–3 divided doses daily, together with cloxacillin 25–50 mg/kg (maximum 2 g) orally every 6 hours for at least 3 weeks

*Pneumonia in adults and children > 5 years*

- Hospitalized patients
  - Adults: 5–7 mg/kg IV daily in divided doses, together with benzylpenicillin 2 million IU IV or IM every 4–6 hours for 7 days.
  - Children > 5 years: 7.5 mg/kg IV in 1–3 divided doses daily, together with benzylpenicillin 50,000–100,000 IU/kg (maximum 2 million IU) IV or IM every 4–6 hours for 7 days
- Patients with atypical pneumonia should also receive erythromycin 1 g (children: 10 mg/kg; maximum 1 g) IV every 6 hours for 14 days

*Nosocomial pneumonia*

- Adults: 5–7 mg/kg IV daily in divided doses for 7 days, supplemented by either cloxacillin 1–2 g IV every 6 hours or ceftazidime 1 g IV every 8 hours
- Children: 7.5 mg/kg IV in 1–3 divided doses daily for 7 days, supplemented by either cloxacillin 50 mg/kg (maximum 2 g) IV every 6 hours or ceftazidime 25 mg/kg (maximum 1 g) IV every 8 hours

---

In hospitals with a high prevalence of meticillin-resistant *Staphylococcus aureus*, vancomycin 1 g (children: 20mg/kg; maximum 1 g) IV every 12 hours for 10–14 days should be added to the above regimens.

**Neonatal sepsis**

Gentamicin is delivered IV or by IM injection. The dosage of gentamicin is calculated based on patient weight to ensure the appropriate serum concentrations are obtained for safety and efficacy of the drug. Gentamicin has a narrow treatment window and incorrect usage can cause toxicity to the ears, kidneys, and neurological system. The recommended dose range for treatment of neonates is a total of 7.5 mg/kg/day, with one to three doses per day for seven to ten days. The WHO-recommended weight bands of gentamicin for inpatient treatment are summarized below.

**WHO Recommended Gentamicin for Inpatient Treatment**

*(All doses to be drawn from a 10 mg/ml stock concentration)*

**Other infections**

*Adults*

- Serious infections: If renal function is not impaired, 5mg/kg/daily in divided doses at 6- or 8-hourly intervals. The total daily dose may be subsequently increased or decreased as clinically indicated.
- Systemic infections: If renal function is not impaired, 3–5 mg/kg/day in divided doses according to severity of infection, adjusting according to clinical response and body weight.
- Urinary tract infections: As for “Systemic infections,” above. Or, if renal function is not impaired, 160 mg once daily may be used.

---

Pediatric patients

- The daily dose recommended in children aged 1 year and above and adolescents with normal renal function, is 3–6 mg/kg body weight per day as 1 (preferred) up to 2 single doses.
- The daily dose in infants after the first month of life is 4.5–7.5 mg/kg body weight per day as 1 (preferred) up to 2 single doses.
- The daily dose in neonates and preterm infants (aged 0–4 weeks old) is 4–7 mg/kg body weight per day. Due to the longer half-life, newborns are given the required daily dose in 1 single dose.

The elderly

- There is some evidence that elderly patients may be more susceptible to aminoglycoside toxicity, whether secondary to previous eighth-nerve impairment or to borderline renal dysfunction. Accordingly, therapy should be closely monitored by frequent determination of gentamicin serum levels, assessment of renal function, and signs of ototoxicity.

Renal impairment

- In impaired renal function, the recommended daily dose must be decreased and adjusted according to renal function.
- Gentamicin is excreted by simple glomerular filtration; therefore a reduced dosage is necessary where renal function is impaired.

Contraindications

Hypersensitivity to the gentamicin or to any of the excipients, pregnancy, and myasthenia gravis.

Special warnings and precautions for use

To avoid adverse events, continuous monitoring (before, during and after) of renal function (serum creatinine, creatinine clearance), control of function of vestibule and cochlea, and hepatic and laboratory parameters is recommended.

Ototoxicity has been recorded following the use of gentamicin. Groups at special risk include patients with impaired renal function, infants, and possibly the elderly. Consequently, renal, auditory, and vestibular functions should be monitored in these patients and serum levels determined so as to avoid peak concentrations above 10 mg/L and troughs above 2 mg/L when administering gentamicin twice daily and 1 mg/L for a once-daily dose. As there is some evidence that risk of both ototoxicity and nephrotoxicity is related to the level of total exposure, duration of therapy should be the shortest possible compatible with clinical recovery. In some patients with impaired renal function, there has been a transient rise in blood urea nitrogen, which has usually reverted to normal during or following cessation of therapy. It is important to adjust the frequency of dosing according to the degree of renal function.

Gentamicin should be used in pregnancy only if considered essential by the physician (see section 1.6 of this annex, “Pregnancy and lactation”).

Gentamicin should be used with care in conditions characterized by muscular weakness.

In cases of significant obesity gentamicin serum concentrations should be closely monitored and a reduction in dose should be considered.
Interaction with other medicinal products and other forms of interaction

Concurrent administration of gentamicin and other potentially ototoxic or nephrotoxic drugs should be avoided. Potent diuretics such as etacrynic acid and furosemide are believed to enhance the risk of ototoxicity, and amphotericin B, cisplatin and ciclosporin are potential enhancers of nephrotoxicity.

Any potential nephrotoxicity of cephalosporins, and in particular cephaloridine, may also be increased in the presence of gentamicin. Consequently, if this combination is used, monitoring of renal function is advised.

Neuromuscular blockade and respiratory paralysis have been reported from administration of aminoglycosides to patients who have received curare-type muscle relaxants during anesthesia.

Indomethacin possibly increases plasma concentrations of gentamicin in neonates.

Concurrent use with oral anticoagulants may increase the hypothyrombinanemic effect.

Concurrent use of bisphosphonates may increase the risk of hypocalcemia.

Concurrent use of the botulinum toxin and gentamicin may increase the risk of toxicity due to enhanced neuromuscular block.

Antagonism of effect may occur with concomitant administration of gentamicin with either neostigmine or pyridostigmine.

Pregnancy and lactation

There are no proven cases of intrauterine damage caused by gentamicin. However, in common with most drugs known to cross the placenta, usage in pregnancy should be considered only in life-threatening situations where expected benefits outweigh possible risks. In the absence of gastrointestinal inflammation, the amount of gentamicin ingested from the milk is unlikely to result in significant blood levels in breast-fed infants.

Effects on ability to drive and use machines

Not known.

Undesirable effects

Side effects include vestibular damage or hearing loss, particularly after exposure to ototoxic drugs or in the presence of renal dysfunction. Nephrotoxicity (usually reversible) and acute renal failure, hypersensitivity, anemia, blood dyscrasias, purpura, stomatitis, convulsions, and effects on liver function occur occasionally.

Rarely, hypomagnesiemia on prolonged therapy and antibiotic–associated colitis have been reported.

Nausea, vomiting, and rash have also been reported.

Central neurotoxicity, including encephalopathy, confusion, lethargy, mental depression, and hallucinations, has been reported in association with gentamicin therapy but is extremely rare.

Peripheral neuropathy: frequency not known.
**Overdose**

Hemodialysis and peritoneal dialysis will aid removal from the blood, but the former is probably more efficient. Calcium salts given intravenously have been used to counter the neuromuscular blockade caused by gentamicin.
PART 2: SPECIAL CONSIDERATIONS IN QUALITY ASSESSMENT

Information contained in this annex is intended to assist procurement agencies that plan to perform a full prequalification of gentamicin injection products. When assessing the complete quality/CMC documentation, assessors should consider the following particular information on gentamicin injection.

**API**

Gentamicin is not included in the WHO PQP. Therefore no WHO-prequalified gentamicin API exists.

Only two manufacturers of gentamicin sulfate API have obtained the certificate of suitability to monographs of the European Pharmacopoeia (CEP), confirming its suitable quality for use in medicinal product.

Manufacturers of Gentamicin API with CEP Certificate

<table>

<td>2/3/2016</td>
<td>Chemistry</td>
</tr>
</tbody>
</table>

Other manufacturers of gentamicin API should provide evidence for GMP compliance and API quality documentation as per WHO guidelines.³

Gentamicin API must meet pharmacopoeia specifications such as those of the International Pharmacopoeia, European Pharmacopoeia, and US Pharmacopoeia, depending on the quality assurance policy of the procurement agency, or the equivalent thereof.

---

**Excipients**

The typical excipients of gentamicin injection include sodium chloride, water for injection, and sulfuric acid and/or sodium hydroxide, for pH adjustment. There are no special concerns on the excipients. No excipient with the risk of transmitting TSE/BSE is used.

The quality of all excipients should be compliant with recognized pharmacopoeias (Ph.Int., Ph.Eur./BP, or USP).

Some formulations may contain methylparaben and propylparaben as preservatives when the product is intended for multiple-dose use. Where methylparaben and propylparaben are included in the formulation antimicrobial preservatives, their assays (preservative contents) should be included in the FPP specifications. If the lower limit for the proposed acceptance criterion for the assay of parabens is below 90.0%, its effectiveness should be established by appropriate studies (e.g., USP or Ph.Eur. general chapters on antimicrobial preservatives) using a batch of the FPP containing a concentration of methylparaben and propylparaben corresponding to the lower proposed acceptance criterion.

Where sodium metabisulfite is included in the formulation as an antioxidant, the effectiveness of the proposed concentration should be justified and verified by appropriate studies.

**Manufacturing process**

Gentamicin injection is a straightforward drug to manufacture, but the main quality concern is the sterilization process together with the sterility of the facility where it is made.

The manufacturing process of gentamicin injection is a standard process—conducted under appropriate aseptic conditions—including the steps of preparation of the solution with adjustment of pH, prefiltration and sterile filtration, and filling and sealing of the ampoules. Satisfactory operating parameters and in-process controls should be defined at each stage of manufacturing.

The filters used in sterile filtration should be validated with respect to pore size, compatibility with the product, absence of extractables, and lack of adsorption of the API or any of the components. The headspace of the vials should be replaced with nitrogen during the filling process to prevent oxidation of the API.

A manufacturing process validation protocol for the validation of the first three production-scale batches should be submitted. In addition, completed process validation reports for the sterile processes for three cycles/runs should be submitted. If the manufacturer is already manufacturing production-scale batches, the full validation data for the production of at least three (3) consecutive production-scale batches should be submitted.

**Packaging**

Neutral type I glass vials should be used.

Suitability of container should be demonstrated, including the following properties:

**Safety**

- Glass vials must meet compendial requirements such as USP<660> and USP<1660>. 
Rubber stoppers must meet compendial requirements such as USP<381> and USP<87>/<88>. Composition of the rubber stopper along with a declaration from the supplier that the material is free of 2-mercapto benzothiazoles (2-MCBT) and nitrosamines should be provided.

Washing and sterilization/depyrogenation, if applicable, should be supported by process validation data.

**Protection**

- Container integrity regarding microbial contamination should be demonstrated by microbial or dye ingress or other methods:
  - One-time test reported as part of product development
  - Routine leak testing performed as part of product manufacture

**Compatibility**

- Extractables/leachables data of the rubber stoppers should be provided.
- Accelerated and long-term stability data on vials stored in inverted orientation should be submitted to further support absence of leachables as well as sorption.
- Compatibility of the FPP with diluents (such as 5% dextrose injection or 0.9% sodium chloride as per the label instruction), if relevant, over the proposed dilution range (label) in specified containers may also need to be demonstrated.

**Bioequivalence requirements**

A biowaiver can be requested as per WHO Technical Report Series, No. 992, which indicates that no bioequivalence study is necessary when the pharmaceutical product is to be administered parenterally (e.g., intravenously, subcutaneously, or intramuscularly) as an aqueous solution containing the same API in the same molar concentration as the comparator product and with the same or similar excipients in comparable concentrations as in the comparator product.

Appropriate comparator products are Cidomycin® (gentamicin injection 80 mg/2 mL solution for injection 40 mg/mL, Sanofi-Aventis), gentamicin sulfate injection 10 mg/mL, 40 mg/mL (Fresenius Kabi, USA), and gentamicin sulfate injection 10 mg/mL, 40 mg/mL (Hospira, USA). The composition of the proposed product should be the same as the comparator product.
