

OXYTOCIN SUPPLY CHAIN MANAGEMENT

Oxytocin is a life-saving commodity for women. It is a temperature-sensitive medicine and so its potency must be protected all through the supply chain.

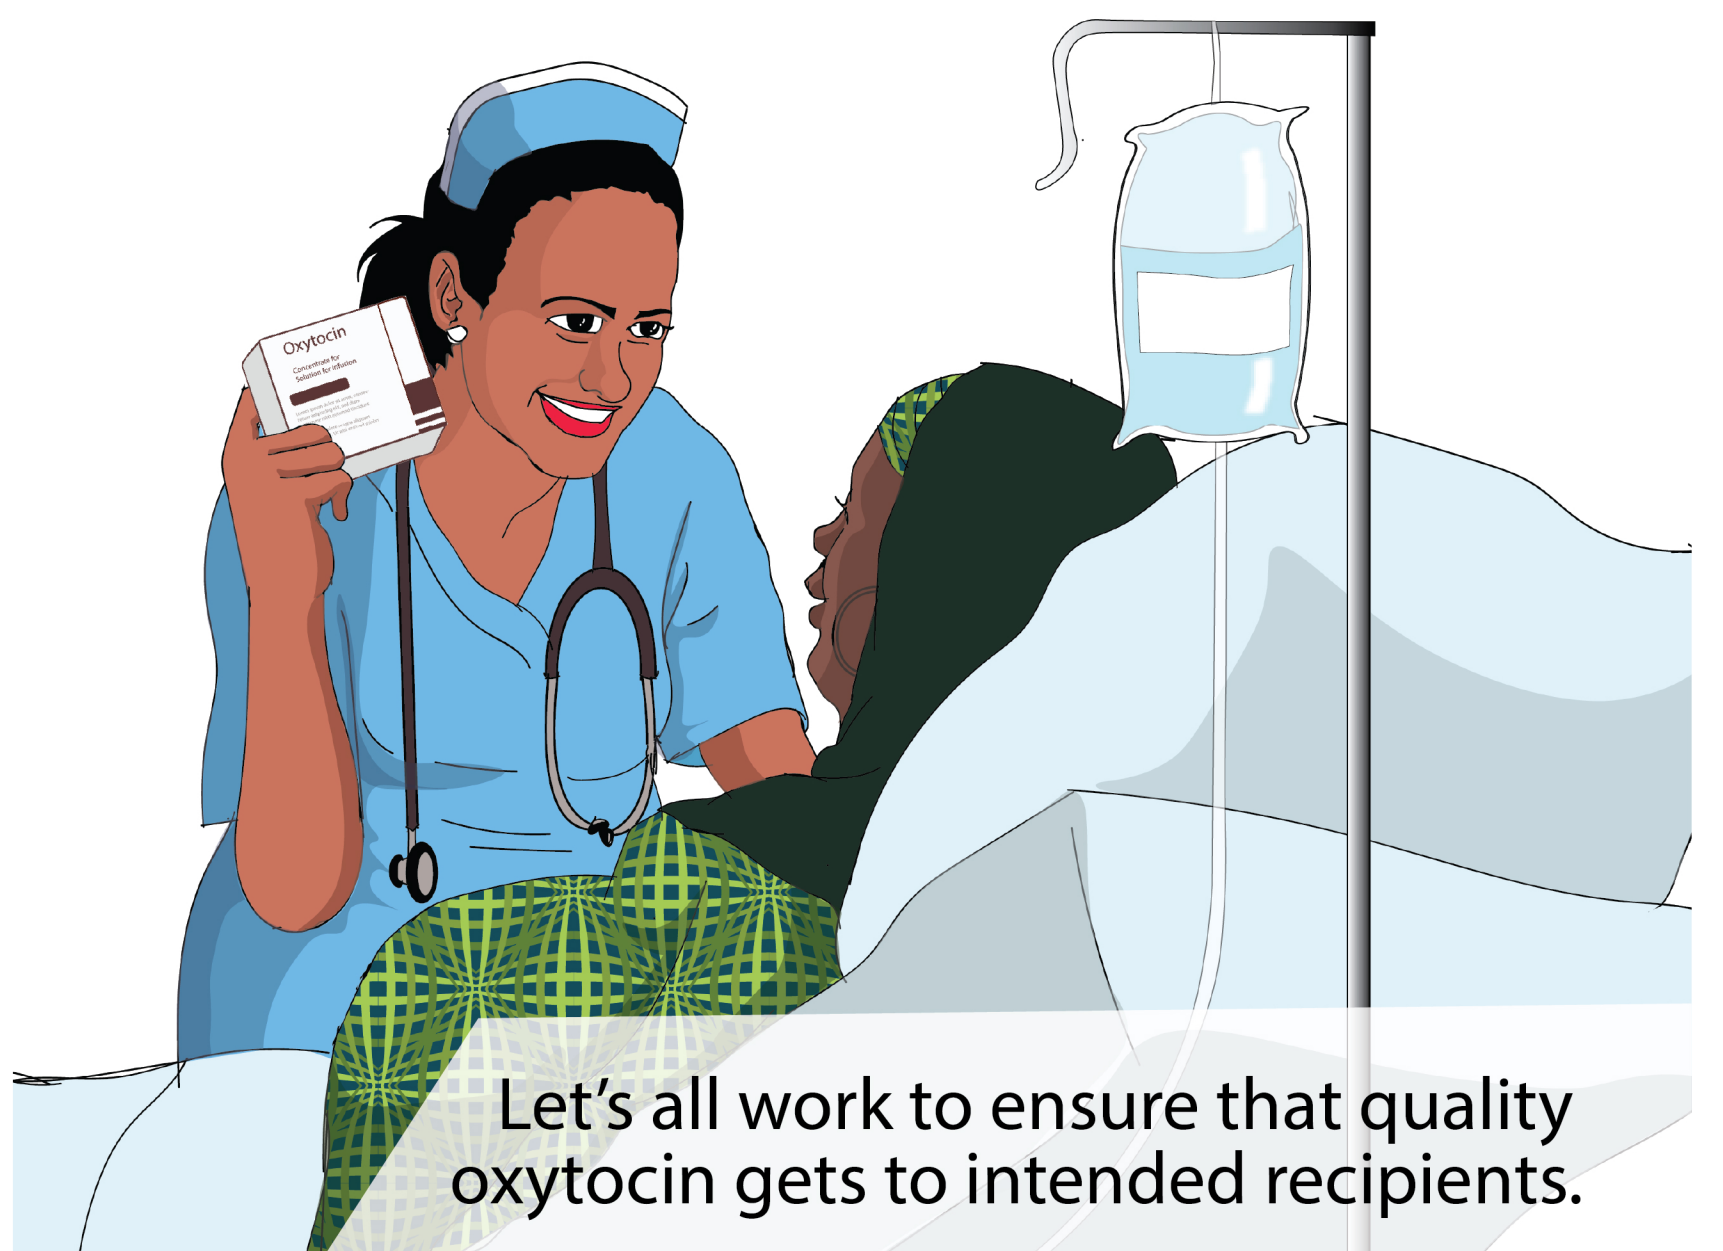

Transport oxytocin under cold-chain conditions (in cold boxes or temperature-controlled vans).

At the store and in the clinic, always maintain temperature between 2-8°C. If stored at temperature above 30°C, it loses its effectiveness.

Always keep oxytocin in the refrigerator or in the cold box.

Let's all work to ensure that quality oxytocin gets to intended recipients.
